

STARTUP & SCALEUP Portfolio

The TETRA project has received funding from the European Union's Horizon 2020 Research and Innovation Programme under Grant Agreement No 825147

Introduction

We, at NGI TETRA, believe that co-innovation is essential for sustainable growth.

This portfolio will introduce you to promising startups coached in the frame of the Next Generation Internet (NGI) TETRA initiative.

The NGI initiative launched by the European Commission in 2016, aims to shape the future internet as an interoperable platform ecosystem that embodies the values that Europe holds dear: openness, inclusivity, transparency, privacy, cooperation, and protection of data.

TETRA is a business accelerator for startups who received funding through an NGI Open Call.

Our objective is to help NGI startups accelerate from “R&D stage” to “Go-To Market stage” based on the exact needs and struggles of each team.

We are delighted to connect NGI startups with you for potential collaboration, and remain at your disposal for any questions you might have.

Our Startups

Based

Based is a data platform that allows developers to build and iterate faster, using the power of a custom-built real-time graph database.

Based is built because of the experience that most development time is ultimately spent on making disparate infrastructure services (like those from AWS or Google Cloud) work together in a scalable system. By integrating the most used functionalities in web development, bundled together, exposed through a developer-friendly API, we cut down development time significantly, and lower the bar for developers to be able to create cutting-edge applications. Our system is inherently scalable and will continue to last when applications become successful and scale. This means we help developers build applications from the experimentation and prototyping phase up to full-fledged production.

Binaré

"We Automate IoT Firmware Cybersecurity"

Binaré offers Software-as-a-Service (SaaS) automated solutions for IoT cybersecurity, research, development and technology innovation services, as well as an extensive range of related consulting, training and advisory services. Binaré enables you to improve your IIoT/IoT cybersecurity ROI and posture. We help you reduce costs and maintain your reputation by pro-actively using our solutions and services.

Using Binaré's technology and expertise, your company can cybersecure your entire IoT life-cycle, covering design, development, testing, certification, deployment, operation and decommissioning. We can also help your company become compliant with regulatory and certification requirements.

Collaboration with Binaré provides your company an opportunity to engage with a professional team of internationally renowned researchers and experts.

Data Hop

"Let's democratise content distribution"

DataHop is building the next-generation mobile content distribution network by means of using unused storage capacity of end-users' smartphones to distribute content locally, substituting expensive third-party servers and using peer-to-peer technologies and off-line communications through a new smart device-to-device connectivity solution. DataHop helps disseminate content providers' media content reducing their content distribution costs and increasing users' experience improving content retrieval in poor connectivity scenarios (train, tube, etc.). DataHop is backed by a smart prefetching solution to seed users' based on consumption prediction and utilise Filecoin to safely store content close to end-users at a lower cost of deploying servers at data centres, as traditional content distribution networks do.

Data Hop

Dymaxion

"Fabricating the Modern Dwelling"

The Authcoin system has been developed out of research and provides multi-factor challenge set identity authentication for self-sovereign application. Current identity systems usually employ one, or two fixed challenges for identity authentication. Instead, for the emerging machine-to-everything (M2X) economy, the authentication needs for humans and machines expand and must be flexibly configurable. Authcoin caters for such flexibility and has emerged from research that manifests in several publications and an award-winning PhD thesis about the M2X economy where Authcoin is an essential part. We are now exploring the options for translating the research findings into applications. For that, we currently work in the framework of NGI explorers on the further development related to realizing challenge sets to next aim for an application-system deployment using smart-contract blockchain technology.

IDISS

IDISS is the digital transformation enabler against data silos. Domain experts are able to bridge their data among data silos by providing their shared semantic as a common denominator, untangling complexity, harmonizing quality data.

This shared semantic enables the generation of transformations, documentation and validators while domain experts will only add their minimum data set. Only such automation guarantees high quality, fast deployments, saving the precious time of manual work!

Built upon the latest technologies, IDISS is taking the EU e-invoice norm (EN16931) as an initial example, bridging the XML of OASIS UBL and UN/CEFACT CII.

KORUZA

"Light-speed networking"

KORUZA is a custom technology that can be integrated in several solutions for endless applications. It can serve as an alternative to laying fibre-optic cable in urban areas, connect machines in an industrial set-up, offer connectivity in a transport chain (ship-to-shore, container-to-crane etc.), and much more.

Technically, KORUZA is a wireless free-space optical (FSO) communication technology. It is a low-maintenance, interference-free operation, designed for industrial and urban areas, and can be rolled-out with minimal infrastructure investment. Data is securely transmitted over a collimated eye-safe IR laser beam, with 1 Gbps or 10 Gbps transfer speed, at distances up to 150 m.

KORUZA's developer and integrator is company IRNAS.

Magos

"Touching the intangible"

A solution that enables freedom of fingers movement can play an important role in the future; it is an essential aid for virtual simulations and training applications which prepare individuals to work and perform in highly demanding and stressful environments. That would enable a user to interact with buttons in a virtual cockpit using their fingers instead of holding a pair of touch controllers, or a trainee doctor to be trained in performing surgical tasks interacting with the tools-environment using finger details like in the natural world.

MeDDEa Solutions Ltd

MeDDEa Solutions, a startup born of the NGI eSSIF-Lab project SSI-Sharing, delivers data solutions for the fast-expanding field of Digital Healthcare. Based on a fully decentralised technology stack, MeDDEa builds the first interoperability infrastructure for healthcare.

We secure data itself, so it moves across platforms. Our Dynamic Data Sharing Hub is the key innovation of our NGI project, where we dealt with patient recruitment in clinical trials. We evolve our initial component into a Data Search Engine that provides a new approach for criteria search on sensitive data.

With authentic remote source data verification (rSDV) the search engine facilitates randomised controlled clinical trials (RCTs). We enable user-centric, platform-less solutions for securely sharing personal information under the self-determined control of the individual. The aim is to achieve data privacy by design across jurisdictions.

The user (data subject) can securely exchange verifiable certificates, such as passes and related personal and health data of any size. Any legitimate verifier, such as a delegated practitioner or public authority officer, can authenticate the information and its provenance and record the consent.

QuarkXR

"QuarkXR is among the few companies pushing the boundaries of what's possible in virtual spaces"

QuarkXR is a deep tech company building out the Cloud Streaming Platform for XR (XR stands for Augmented and Virtual Reality). We're developing compression and streaming technology as an open platform for XR developers.

XR devices are caught in a triangle of cost, form factor, and image quality. QuarkXR can solve that trilemma by utilizing our streaming technology, 5G, and Edge Computing. We believe there's lot's of innovation yet to come in XR. This is why QuarkXR is an open platform for developers who want to leverage streaming and are working on the XR devices, peripherals, apps, and content of tomorrow. Best use cases for QuarkXR: Remote work & collaboration, Industrial applications, VR Arcades.

Re-Isearch

Project re-Isearch is a novel multimodal search and retrieval engine that indexes the content and structure of all kinds and formats of documents.

Search for words, phrases, relationships, and values. It supports search across its data and metadata using a word or phrase and incorporates Boolean logic, paths, wildcards, case-sensitivity, punctuation sensitivity, diacritic sensitivity, and search term weighting.

Provides numerous object types (numerical, hash, geospatial, etc.) with their own methods of search and allows these to be viewed parallel as text.

Not based on conventional inverted indexing algorithms, its design places no limitations on the frequency of words, term length, number of fields or complexity of structured data and supports even overlap - where fields or structures cross other's boundaries.

COMPANY PROFILE

Reowolf

"Synchronous Internet communication reducing transit costs and increasing end-to-end security"

During our NGI-supported research, we discovered a technique for potentially speeding up communication links using high-resolution clocks. Under specific conditions more data may be sent on links than is traditionally the case, by means of advanced synchronization and packet delivery scheduling algorithms, thus delaying the need for capital investment needed for extending bandwidth. This can be very interesting for tier 2/3 network operators who are purchasing IP transit to connect with remote networks. Additionally, the technology can be used to increase end-to-end confidentiality beyond classical encryption techniques, without the need for adapting the underlying transit networks. We are looking into setting up a spin-off company, in which we do more research, patent this technology, and develop it into a market-ready product.

Rosetta

"We focus our efforts on creating global connectivity"

There is a need for a decision-support and action-support system for more radical innovation in new product development. We propose a novel method for firms' new product development ideas via Artificial Intelligence (AI) and Machine Learning (ML) technologies as the toolbox.

The project emphasizes that a hybrid approach to Idea Management (IM) is superior to sole computational evaluations or human decisions. Machines are better in information processing and providing results, while humans present biases.

Nowadays, many IM systems prioritize organizing ideas, checking them internally against other ideas proposed, and suggesting rankings and evaluations based on corporate criteria.

Innovation-related roles use the systems to influence their decision-making about which ideas go next in the system and which get a "permanent parking". With Rosetta, we would be able to propose decisions and actions by overcoming the limitations of the systems like local searches and data processing constraints.

COMPANY PROFILE

Founding year 2021	Team size 3+	Core team location Aarhus - Denmark
------------------------------	------------------------	---

Current stage
Early-stage

Key technologies
Big Data, Artificial Intelligence, Machine Learning, Software as a Service

PRODUCT DETAILS

Product type Software Platform Big data	Customer focus B2B, B2B2C	Target market International
--	-------------------------------------	---------------------------------------

CURRENT NEEDS

Co-funders and development, funding

Rouster

"The only computer you'll ever need"

Rouster is devoted to building the best personal computer on the market and putting it in the hands of everybody. We develop innovative and disrupting technologies while executing scalable and profitable business models. We provide to our users technologically better yet more affordable products than anything else available. We provide to our investors meaningful, good for the planet yet profitable investment. We are a single-founded company with a simple ownership structure and a great team.

Rouster is a new paradigm in the architecture of the personal computer. It moves all fast aging components to the cloud and thus creating the next-generation computer that will never need to be changed again, it is extremely small, more powerful, cheaper, environment friendly, and with no hardware limitations.

COMPANY PROFILE

Founding year 2018	Team size 3	Core team location Sofia - Bulgaria
------------------------------	-----------------------	---

Current stage Seed	Key technologies Cloud, 5G, Ultra-low latency streaming
------------------------------	---

PRODUCT DETAILS

Product type Hardware, Cloud, Software	Customer focus B2C	Target market International
--	------------------------------	---------------------------------------

CURRENT NEEDS

Funding, Co-creation, B2B2C partnership

Sosteco

"We focus our efforts on creating global connectivity"

Sosteco is dedicated to the research and creation of innovative solutions for IoT and WSN. The platforms and products are designed and projected in Spain, Malaga.

Sosteco's mission is to look for projects, innovative products, and easy solutions for customers. The company offers a new dimension of technology providing the best support and promoting a relationship of trust. Sosteco is a reference in intelligent city projects with a positive impact on people's lifestyles through the promotion of better use of natural resources, energy efficiency and ease of use.

The team is composed of engineers and technicians focused on different areas such as electronics, design, and software. Sosteco designs hardware and software from scratch and is ready to use other manufacturers to achieve the goal of reaching the intelligent city of the future.

Startin'blox

"Connecting to the world"

Startin'blox is a European leader in the new architectures induced by the standards like Solid, IDS and Gaia-X, Startin'blox helps ecosystems of companies work better together without even having to all use the same tools. We developed an innovative technology, based on Solid and Tim Berners-Lee's vision, the founder of the Web. Our apps are based on ready made modules, easily assembled together to become a fully functional application that our users can then customize as much as they want to fit their business processes.

Vivaet

"We focus our efforts on creating global connectivity"

We seek to create visual identities for virtual agents capable of extracting the maximum empathic response from human users. We employ neuroscience and psychology methods as well as machine-learning and smart sensor electronics to create an empathic human-AI habitat/interface that will have its first application in patient-medical AI interactions. We place ourselves ahead of the curve to have an empathic AI identity at the ready for implementation when the first medical AIs (created by other companies) will be implemented in the next 5-10 years.

COMPANY PROFILE

Founding year	Team size	Core team location
2021	8	Suceava - Romania

Current stage	Key technologies
Technology concept formulated	Smart-sensors, machine-learning, AI

PRODUCT DETAILS

Product type	Customer focus	Target market
Software, physical human-AI interface and sense-react habitat	Hospitals	Health

CURRENT NEEDS

Funding, co-creation
